

Evaluation of the invention of „Detensor“,
a long-term traction system for introduction
in conferring to the title of „doctor of medical sciences“
Mr. Kurt L. Kienlein

The long term effect of the Detensor-System during active medical treatment on my own body, grant me the right to compile this evaluation.

Following participation in the cleaning up of the catastrophe at the nuclear power plant Tschernobyl in 1986, I received a total dosage of radioactive radiation of approximately 650 REM's, leading to injuries in the following portions of my body: In the brain, the digestive organs, respiratory organs and the coronary arteries.

Repeated medical treatments at the 6th Moscow Clinic, the 25th Clinic at Kiev, the Pierre-Curie Hospital in Paris and the University clinic at Hannover contributed to the temporary improvement of my health, however, without lasting effect. A rapid decline in my condition of health set in towards the end of 1993. I was plagued by constant pain in the spine, the pelvic region and in the legs.

My health had improved already after 3 months of using the Detensor-System, i.e. the stationary mattress, the portable mat and the stool. The pain in the pelvic region had vanished, so had the cramps in my legs. The functions of my inner organs became more normalized and the blood pressure became stable, having been unstable before which had led to cramps in the cerebral circulation and constrictions of the coronary arteries. Thereafter, a general improvement of all functions of the body had set in. The application of the portable Detensor-Device, was used with the onset of fatigue during extended travel activities, leading to similar effects. Elimination of fatigue and rapid improvement of total body activity, which consequently increased my ability to work.

I find, that the developed method for total healing of the human body with the aid of the Detensor-System can be applied extremely successfully and effectively to medical rehabilitation, not only for spinal injuries of the human body, but also in cases of irradiation with high radioactive dosage.

I find, that the „Detensor“ can be applied effectively in the clinical or outpatient treatment of those injured by atomic catastrophies..Continuous observation by medical personnel is not necessary. Long time application of the Detensor-Devices lead only to effective results. Negative effects have not been registered.

I find, that the inventor of the Detensor-Method, Mr. Kurt L. Kiehnlein, is completely worthy of the scientific title „doctor of medical sciences“.

*Scientific Head in the staff for disposal of catastrophies at the
restricted zone of the nuclear power plant, Tschernobyl in 1986*

*Dr. of Physics, Dr. of Mathematics
Professor*
